MAINTENANCE FREE

Building Regulations and Local Authority Bylaws state that manholes, inspection chambers and rodding eyes must be provided to give ready access to underground drains for maintenance and cleaning.

When designed and installed correctly the Hunter Drain and Sewer systems are maintenance free. However as small bore drains are more likely to block through misuse, a comprehensive range of preformed inspection chambers, shallow access chambers, access fittings and rodding eyes are available.

Before any of the above methods of access are adopted the Local Authority must be consulted to ascertain their own specific requirements.

Conventional rods, implements and specialist power assisted equipment maybe used for cleaning a PVCu drain. It is necessary to ensure that cleaning equipment, particularly the end implement, will not cause damage to the pipe and fitting walls.

Should it become necessary to repair or extend a drainage system then use of a Hunter (DS212/DS410) Slip Coupler can be made.

The maintenance of drains and sewer systems outside buildings is regulated by BSEN 752-7: 1998.
